

Introduction to universal principles and their role in creating your reality

ADE Workbook · An MPA metalkimical perspective

This workbook does not contain truths you must adopt. It contains seven lenses for observing a situation, testing relationships and recognizing alternatives that were not yet available to your gaze.

The reality I bring

Choose a conversation, decision, relationship or situation that seems to have only one explanation today. Write it without improving it.

01 · Mentalism

Every lived reality reaches us through a mental configuration.

Hermetic tradition states that 'the All is mind'. MPA does not use this to claim that thinking something is enough to produce it, or that a person is responsible for everything that happens to them. It is an invitation to recognize the architecture through which an experience becomes intelligible. Like an architect who imagines, selects and organizes before building, the mind relates data, memories, expectations and affects. It does not invent the terrain, but it participates in the form our experience of that terrain can take.

What interpretation is organizing the situation you brought?

02 · Correspondence

A part may reveal relationships within the whole, if we verify them in both directions.

'As above, so below; as within, so without' appears in the source documents as the image of a mirror. Here we make it more precise: correspondence does not mean that everything outside is your projection or that you should blame yourself for what happens. It means that a form may preserve recognizable relationships across scales or planes. A disordered room may correspond with a confused moment, but it may not. The operation is to compare, travel back from outside to inside, and verify whether the relationship holds.

What pattern appears in more than one part of your situation? Does it hold on the way back?

03 · Vibration

Nothing alive remains exactly identical.

The original texts begin with 'nothing rests; everything moves'. We can observe this without turning movement into a moral scale of high and low vibrations. A seemingly still body breathes; a stable relationship changes its agreements; a repeated idea changes force with context. We sometimes suffer because we treat a temporary form as if it had to remain intact. Perceiving movement does not require letting go of everything: it lets us distinguish what is already changing, what we try to preserve, and where intervention is still possible.

What is changing even though your story presents it as fixed?

04 · Polarity

Two opposites may be different degrees of the same dimension.

Cold and heat are not enemy substances; they name positions on a thermal scale. Polarity invites us to find the shared dimension before becoming trapped in a binary choice. This does not mean that every extreme is equivalent or that the middle is always best. It means testing whether what we call opposites belongs to the same continuum and which intermediate degrees have disappeared from view. Transformation begins when more than one position becomes possible.

Which two poles are you treating as the only alternatives? What dimension do they share?

05 · Rhythm

Movements leave traces, intervals and recurrences.

The manuscript uses the wave and the pendulum: rise, fall, advance and retreat. Its value is not in promising that every fall will be compensated exactly, but in teaching us to observe sequences. Conversations, states and projects have different timings. Recognizing rhythm prevents us from confusing one phase with the whole and lets us prepare: save during expansion, rest after effort, or intervene before a repetition closes over itself again.

What sequence repeats? Where in the cycle are you today?

06 · Cause and effect

Every action participates in a network of consequences, but rarely acts alone.

The source material speaks of sowing and harvesting. We preserve responsibility without turning it into guilt or punitive karma. One consequence may have many causes, conditions and participants; one action may produce different effects depending on the system it enters. The useful question is not 'what did I do to deserve this?' but 'what actions, omissions and conditions produce or preserve this configuration?'. Where participation becomes visible, response-ability may appear.

What sustains this situation today? Separate what depends on you from what does not.

07 · Generation

When two forces enter a relationship, a third may emerge that neither contained alone.

The generation documents sought to integrate complementary energies. MPA moves the focus from fixed identities to emergent function. A battery, conductor and lamp do not separately contain the light turned on; the function appears when the relationship configures a circuit. Likewise, two people do not merely affect each other: they may produce a conversation, alliance, rivalry or institution. That third then begins to influence those who generated it.

What system does the relationship you are observing produce? What does it enable and preserve?

The third you were not looking at

Separate the two forces you were treating as the only ones. Then observe the system they produce together and how that third influences its parts.

First force

Second force

The third that emerges

One possible movement

Do not leave with an answer. Leave with a more precise observation.
